1 Data

1.1 Data example

We use data about penguins from the R package palmerpenguins

```
pingviner <- palmerpenguins::penguins
pingviner
```

```
## # A tibble: 344 x 8
##   species island   bill_length_mm bill_depth_mm flipp~ body~ sex   year
##   <fctr> <fctr>         <dbl>         <dbl> <int> <int> <fct> <int>
## 1 Adelie Torgersen         39.1           18.7   181  3750 male  2007
## 2 Adelie Torgersen         39.5           17.4   186  3800 fema~ 2007
## 3 Adelie Torgersen         40.3           18.0   195  3250 fema~ 2007
## 4 Adelie Torgersen         NA              NA       NA    NA <NA> 2007
## 5 Adelie Torgersen         36.7           19.3   193  3450 fema~ 2007
## 6 Adelie Torgersen         39.3           20.6   190  3650 male  2007
## 7 Adelie Torgersen         38.9           17.8   181  3625 fema~ 2007
## 8 Adelie Torgersen         39.2           19.6   195  4675 male  2007
## 9 Adelie Torgersen         34.1           18.1   193  3475 <NA> 2007
## 10 Adelie Torgersen         42.0           20.2   190  4250 <NA> 2007
## # ... with 334 more rows
```

2 Summaries and plots of qualitative variables

2.1 Tables of qualitative variables

- The main function to make tables from a data frame of observations is `tally()` which tallies (counts up) the number of observations within a given category. E.g:

```
tally(~species, data = pingviner)
```

```
## species
##   Adelie Chinstrap   Gentoo
##     152         68     124
```

```
tally(species ~ island, data = pingviner)
```

```
##           island
## species   Biscoe Dream Torgersen
##   Adelie      44    56         52
##   Chinstrap    0    68          0
##   Gentoo     124    0          0
```

2.2 Plots of qualitative variables

- The main plotting functions for qualitative variables are `gf_percents()` and `gf_bar()`. E.g:

```
gf_percents(~species, data = pingviner)
```

```
gf_percents(~species, fill = ~sex, data = pingviner)
```

```
gf_percents(~species, fill = ~sex, data = pingviner, position = position_dodge())
```

3 Summaries of quantitative variables

3.1 Percentiles

- **The p th percentile** is a value such that about $p\%$ of the sample lies below or at this value and about $(100 - p)\%$ of the sample lies above it.
- To calculate a percentile, first sort data in increasing order. For the `bill_length_mm` of `Gentoo` penguins it is:

$$y_{(1)} = 40.9, y_{(2)} = 41.7, y_{(3)} = 42, \dots, y_{(n)} = 59.6.$$

Here the number of observations is $n = 123$ (omitting any NAs).

- Find the 5th percentile (i. e. $p = 5$):
 - The observation number corresponding to the 5-percentile is $N = \frac{123 \cdot 5}{100} = 6.15$.
 - So the 5-percentile lies between the observations with observation number $k = 6$ and $k + 1 = 7$. That is, its value lies somewhere in the interval between $y_6 = 42.8$ and $y_7 = 42.9$.
 - One of several methods for estimating the 5-percentile from the value of N is defined as:

$$y_{(k)} + (N - k)(y_{(k+1)} - y_{(k)})$$

which in this case states

$$y_6 + (6.15 - 6)(y_7 - y_6) = 42.8 + 0.15 \cdot (42.9 - 42.8) = 42.81$$

3.2 Measures of center of data: Mean and median

- A number of numerical summaries can be retrieved using the `favstats` command:

```
favstats(bill_length_mm ~ species, data = pingviner)
```

```
##      species min Q1 median Q3 max mean  sd   n missing
## 1   Adelie  32 37   39 41  46  39 2.7 151     1
## 2 Chinstrap 41 46   50 51  58  49 3.3  68     0
## 3   Gentoo 41 45   47 50  60  48 3.1 123     1
```

- The observed values of `bill_length_mm` are $y_1 = 46.1, y_2 = 50, \dots, y_n = 49.9$, where there are a total of $n = 123$ values (omitting any NAs). As previously defined this constitutes a **sample**.
- **mean** = 48 is the **average** of the sample, which is calculated by

$$\bar{y} = \frac{1}{n} \sum_{i=1}^n y_i.$$

We may also call \bar{y} the **(empirical) mean** or the **sample mean**. It is calculated using `mean()` in **R**.

- **median** = 47 is the 50-percentile, i.e. the value that splits the sample in 2 groups of equal size. It is calculated using `median()` in **R**.
- An important property of the **mean** and the **median** is that they have the same unit as the observations (e.g. millimeter).

3.3 Measures of variability of data: range, standard deviation and variance

- The **range** is the difference of the largest and smallest observation (`range()` in **R**).
- The **(empirical) variance** (`var()` in **R**) is the average of the squared deviations from the mean:

$$s^2 = \frac{1}{n-1} \sum_{i=1}^n (y_i - \bar{y})^2.$$

- **sd** = **standard deviation** = $s = \sqrt{s^2}$ (`sd()` in **R**).
- Note: If the observations are measured in mm, the **variance** has unit mm^2 which is hard to interpret. The **standard deviation** on the other hand has the same unit as the observations.
- The standard deviation describes how much data varies around the (empirical) mean.

3.3.1 The empirical rule

If the histogram of the sample looks like a bell shaped curve, then

- about 68% of the observations lie between $\bar{y} - s$ and $\bar{y} + s$.
- about 95% of the observations lie between $\bar{y} - 2s$ and $\bar{y} + 2s$.
- All or almost all (99.7%) of the observations lie between $\bar{y} - 3s$ and $\bar{y} + 3s$.

4 Target population and random sampling

4.1 Population parameters

- When the sample size grows, then e.g. the mean of the sample, \bar{y} , will stabilize around a fixed value, μ , which is usually unknown. The value μ is called the **population mean**.
- Correspondingly, the standard deviation of the sample, s , will stabilize around a fixed value, σ , which is usually unknown. The value σ is called the **population standard deviation**.
- Notation:
 - μ (mu) denotes the population mean.
 - σ (sigma) denotes the population standard deviation.

Population	Sample
μ	\bar{y}
σ	s

4.1.1 A word about terminology

- **Standard deviation:** a measure of variability of a population or a sample.
- **Standard error:** a measure of variability of an estimate. For example, a measure of variability of the sample mean.

4.2 Aim of statistics

- Statistics is all about “saying something” about a population.
- Typically, this is done by taking a random sample from the population.
- The sample is then analysed and a statement about the population can be made.
- The process of making conclusions about a population from analysing a sample is called **statistical inference**.

4.3 Random sampling schemes

Possible strategies for obtaining a random sample from the target population are explained in Agresti section 2.4:

- **Simple sampling: each possible sample of equal size equally probable**
- Systematic sampling
- Stratified sampling
- Cluster sampling
- Multistage sampling
- ...

5 Biases

5.1 Types of biases

Agresti section 2.3:

- Sampling/selection bias
 - Probability sampling: each sample of size n has same probability of being sampled
 - * Still problems: undercoverage, groups not represented (inmates, homeless, hospitalized, ...)
 - Non-probability sampling: probability of sample not possible to determine
 - * E.g. volunteer sampling
- Response bias
 - E.g. poorly worded, confusing or even order of questions
 - Lying if think socially unacceptable
- Non-response bias
 - Non-response rate high; systematic in non-responses (age, health, believes)

5.2 Example of sample bias: United States presidential election, 1936

(Based on Agresti, this and this.)

- Current president: Franklin D. Roosevelt
- Election: Franklin D. Roosevelt vs Alfred Landon (Republican governor of Kansas)
- Literary Digest: magazine with history of accurately predicting winner of past 5 presidential elections

5.2.1 Results

- Literary Digest poll: Landon: 57%; Roosevelt: 43%
 - Actual results: Landon: 38%; Roosevelt: 62%
 - Sampling error: $57\% - 38\% = 19\%$
 - Practically all of the sampling error was the result of **sample bias**
 - Poll size of > 2 mio. individuals participated – extremely large poll
-

5.2.2 Problems (biases)

- Mailing list of about 10 mio. names was created
 - Based on every telephone directory, lists of magazine subscribers, rosters of clubs and associations, and other sources
 - Each one of 10 mio. received a mock ballot and asked to return the marked ballot to the magazine
- “respondents who returned their questionnaires represented only that subset of the population with a relatively intense interest in the subject at hand, and as such constitute in no sense a random sample ... it seems clear that the minority of anti-Roosevelt voters felt more strongly about the election than did the pro-Roosevelt majority” (*The American Statistician*, 1976)
- Biases:
 - Sample bias
 - * List generated towards middle- and upper-class voters (e.g. 1936 and telephones)
 - * Many unemployed (club memberships and magazine subscribers)
 - Non-response bias
 - * Only responses from 2.3/2.4 mio out of 10 million people

5.3 Example of response bias: Wording matters

New York Times/CBS News poll on attitude to increased fuel taxes

- “Are you in favour of a new gasoline tax?” - 12% said yes.
- “Are you in favour of a new gasoline tax to decrease US dependency on foreign oil?” - 55% said yes.
- “Do you think a new gas tax would help to reduce global warming?” - 59% said yes.

5.4 Example of response bias: Order of questions matter

US study during cold war asked two questions:

1 “Do you think that US should let Russian newspaper reporters come here and sent back whatever they want?”

2 “Do you think that Russia should let American newspaper reporters come in and sent back whatever they want?”

The percentage of yes to question 1 was 36%, if it was asked first and 73%, when it was asked last.

5.5 Example of survivor bias: Bullet holes of honor

(Based on this.)

- World War II
- Royal Air Force (RAF), UK
 - Lost many planes to German anti-aircraft fire
- Armor up!
 - Where?
 - Count up all the bullet holes in planes that returned from missions
 - * Put extra armor in the areas that attracted the most fire

-
- Hungarian-born mathematician Abraham Wald:
 - If a plane makes it back safely with a bunch of bullet holes in its wings: holes in the wings aren't very dangerous
 - * **Survivorship bias**
 - Armor up the areas that (on average) don't have any bullet holes
 - * They never make it back, apparently dangerous

Section of plane	Bullet holes per square foot
Engine	1.11
Fuselage	1.73
Fuel system	1.55
Rest of the plane	1.80
